

What Do We Do?

By Duane Graham

Non Participation, just saying no is the key. We can choose to do whatever we want. Just because we are offered choice A or Choice B does not mean we must pick one of them.

The options we as a people have been offered for government, economics and life are binary choices. These choices have been engineered by corporations to keep us in the consumer box so the funds generated from our purchases, "A" or "B" are the ones they want us to have. There are other choices that are not offered.

If the choice is offered by Corporate Swindlers of America, then it is usually the junk, the waste formed by other process that we never see. It really does not matter what these other products are because we are systematically steered away from them and never considered as people capable of having these hidden choices. We are not in their club. Isn't this amazingly like elementary, junior and senior high school?

The waste generated in the manufacturing processes is slipped into our food, water and shelter products, under the guise of "acceptable limits" and we are exposed to whatever is the popular industrial waste.

But "what" do we do?

Well, we must first understand that we need to build our own products, create our own green manufacturing processes and provide the essentials for our communities.

Each community must gather their resources and take stock of what they have. This must be followed by a hard look at raising the living standards so even the least of us finds no need to steal food or other life sustaining resources.

Let those with green thumbs grow food. Let those with technical skills fix, repair and build the technology needed to construct the small community model. Let this model be self-sufficient and provide for the people. Let each community grow a little extra food for trade with other communities. Let the technology be traded and exchanged to support and establish self-sufficient communities.

Create technology to power each home independently without a connection to a power grid. Remove all forms of dependency on the main power and gas grids.

Go off grid. Help other s go off the grid.

Make everything you need. Whatever you make, make a little extra to trade. Pool your resources.

Begin with a cooperative or association to promote self-sustaining communities. End your codependence on the existing power and energy corporations. Recycle and re-engineer the use of everything you can. Waste nothing... someone can use it.
